floor or ceiling projection

# SENse

immersive, interactive sensory system for special needs

The SENse combines high technology with simple design to provide a low cost, mobile, immersive sensory system for special needs, hospitals, physical or social rehabilitation. The SENse offers floor or ceiling projection that responds to body movement when it is detected by the overhead camera. With a mood room lighting control the SENse creates a complete sensory environment by allowing even those with very limited movement to alter many aspects of their immediate environment.

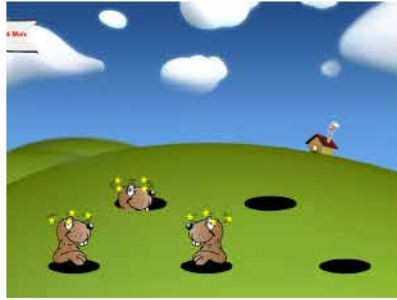

Any image, video and audio file can be added to the many effects available to build up a structured sequence specifically targeted at each learner. Teachers or therapists can design a programme around a pupil's specific needs and link it to a swipe card for re-use at a later date. Multiple users can be added to the system and programmes can be changed by the simple swipe of a card. With in-built wheels the SENse can easily be moved from room to room.

The camera head lowers for easy access through doorways. The SENse is also available as a fixed installation for floor, wall or ceiling projection. Full training is provided with all systems.

The SENse software projects multiple themes and images which are combined with in-built stereo speakers and amp for excellent audio effects. A range of stimulating interactive and colourful games includes 'Splat the Insects', 'Scatter the Stars' and 'Whack-a-Mole'. The high-brightness projector can be mounted to project images onto the floor or ceiling making the system ideal for users who may be in a bed or wheelchair as well as those who are standing or lying on the floor.
